Paper 5 Planning, Analysis and Evaluation

May/June 2023

1 hour 15 minutes

You must answer on the question paper.

No additional materials are needed.

INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

INFORMATION

- The total mark for this paper is 30.
- The number of marks for each question or part question is shown in brackets [].
- The Periodic Table is printed in the question paper.
- Important values, constants and standards are printed in the question paper.

This document has **16** pages. Any blank pages are indicated.

1 The partition coefficient, K_{pc} , shows the distribution of a solute between two immiscible solvents. K_{pc} is determined by measuring the concentration of the solute in each solvent.

The organic solvent ethoxyethane, $\text{CH}_3\text{CH}_2\text{OCH}_2\text{CH}_3$, and water are immiscible. A student is asked to find K_{pc} of butanedioic acid, $\text{HOOCCH}_2\text{CH}_2\text{COOH}$, between ethoxyethane and water.

The expression for K_{pc} when butanedioic acid is in equilibrium between ethoxyethane and water is shown.

$$K_{pc} = \frac{[\text{HOOCCH}_2\text{CH}_2\text{COOH}(\text{ethoxyethane})]}{[\text{HOOCCH}_2\text{CH}_2\text{COOH}(\text{aq})]}$$

[density: ethoxyethane, 0.71 g cm^{-3} ; water, 1.00 g cm^{-3}]

The student uses the following method to find the partition coefficient. A diagram of the apparatus is shown in Fig. 1.1.

step 1 Add 30.0 cm^3 of distilled water to a separating funnel.

step 2 Weigh by difference 2.81 g of butanedioic acid into the separating funnel.

step 3 Stopper the separating funnel and shake it until the butanedioic acid has dissolved.

step 4 Remove the stopper and add 30.0 cm^3 of ethoxyethane to the separating funnel.

step 5 Replace the stopper and shake the separating funnel gently.

step 6 Place the separating funnel into a clamp. Allow the liquids to settle so that the two layers can be seen.

step 7 Remove the stopper and open the separating funnel tap to allow the lower layer to run into a beaker labelled **A**. Run the upper layer into a beaker labelled **B**.

step 8 Transfer 10.0 cm^3 of the aqueous layer into a conical flask. Titrate with $0.500 \text{ mol dm}^{-3}$ $\text{NaOH}(\text{aq})$. Use thymolphthalein as the indicator.

step 9 Take 10.0 cm^3 of the ethoxyethane layer and add 10.0 cm^3 of water to it. Titrate this mixture with $0.100 \text{ mol dm}^{-3}$ $\text{NaOH}(\text{aq})$. Use thymolphthalein as the indicator.

Fig. 1.1

(a) (i) State whether beaker **A** in step 7 contains the aqueous layer or the ethoxyethane layer.

Explain your answer.

Beaker **A** contains the layer.

explanation

..... [1]

(ii) Identify the piece of apparatus that should be used in step 8 to transfer 10.0 cm^3 of the aqueous layer.

..... [1]

(iii) Suggest why water is added to the ethoxyethane layer in step 9 before the titration can take place.

.....

..... [1]

(b) For a 2.81 g sample of butanedioic acid, the titre for the aqueous layer is 27.25 cm³ and the titre for the ethoxyethane layer is 22.50 cm³.

The equation for the reaction between butanedioic acid and sodium hydroxide is shown.

(i) Calculate the concentration of butanedioic acid in the aqueous layer.

$$\text{concentration of butanedioic acid} = \dots \text{mol dm}^{-3} \quad [1]$$

(ii) Calculate the partition coefficient, K_{pc} .

$$K_{\text{pc}} = \dots \quad [2]$$

(iii) Explain why the student is only able to repeat the titration in step 8 once.

.....
.....
.....

[1]

(iv) Suggest how you would modify the procedure to ensure the student can repeat the titration in step 8 more than once.

.....
.....

[1]

(v) A different student forgets to shake the separating funnel in step 5.

Describe the effect this would have on the calculated K_{pc} value. Explain your answer.

effect on K_{pc}

explanation

.....
.....

[Total: 9]

2 Paper chromatography can be used to separate the individual amino acids formed when tripeptides are hydrolysed.

One molecule of a tripeptide produces three amino acid molecules when hydrolysed.

A student is asked to identify the amino acids formed from the hydrolysis of three different tripeptides, **A**, **B** and **C**, using paper chromatography.

Fig. 2.1 shows the results of the student's chromatography experiment.

Fig. 2.1

The individual amino acids can be identified from their R_f values.

$$R_f = \frac{\text{distance travelled by the amino acid spot}}{\text{distance travelled by the solvent front}}$$

(a) Suggest why each sample is applied to the chromatography paper using a thin capillary tube rather than a dropping pipette.

.....
..... [1]

(b) Suggest why it is necessary to spray a developing agent over the chromatography paper before the chromatogram can be analysed.

.....
..... [1]

(c) Table 2.1 shows R_f values for some amino acids in the solvent used in Fig. 2.1.

Table 2.1

| amino acid | R_f value |
|---------------|-------------|
| lysine | 0.14 |
| glycine | 0.26 |
| serine | 0.27 |
| glutamic acid | 0.30 |
| alanine | 0.38 |
| proline | 0.43 |
| tryptophan | 0.50 |
| valine | 0.60 |
| leucine | 0.73 |

Use the data in Table 2.1 to identify the amino acids in tripeptide **A**.

.....
.....

[2]

(d) Suggest why the hydrolysed sample of **B** produces only two spots.

.....
.....

[1]

(e) Two of the spots from the hydrolysed sample of **C** overlap.

(i) State the reason for the overlap.

.....
.....

[1]

(ii) Suggest an improvement to the method that would allow the overlapping spots to be distinguished clearly.

.....
.....

[1]

[Total: 7]

3 A scientist is asked to find the rate of decomposition of an aromatic diazonium compound and determine the order of the reaction with respect to the aromatic diazonium compound.

(a) The scientist is given 1.02 g of an aromatic diazonium compound in a 50 cm³ beaker.

Describe the steps the scientist should take to make a 100.0 cm³ standard solution containing 1.02 g of this compound.

Give the name and capacity of the apparatus the scientist should use.

Write your answer using a series of numbered steps.

.....
.....
.....
.....
.....
.....
..... [3]

(b) Benzenediazonium chloride, an aromatic diazonium compound, decomposes in solution to produce phenol and nitrogen gas. The scientist warms 50 cm³ of the solution to 50 °C. The scientist records the volume of nitrogen gas produced at different times during the decomposition.

(i) Identify the piece of apparatus that should be used to maintain the temperature of the solution.

..... [1]

(ii) Identify the dependent variable.

..... [1]

(iii) Suggest why the scientist does **not** monitor the reaction by measuring the loss in mass.

..... [1]

(c) Table 3.1 shows the results of the experiment.

Table 3.1

| time, t / min | volume, V_t / cm ³ | $V_{\text{final}} - V_t$ / cm ³ |
|-----------------|---------------------------------|--|
| 0 | 0.0 | |
| 5 | 17.3 | |
| 9 | 27.0 | |
| 16 | 39.5 | |
| 21 | 42.6 | |
| 28 | 49.0 | |
| 36 | 52.8 | |
| final | 57.2 | 0.0 |

V_{final} is the final volume of nitrogen gas measured once the decomposition is complete.

V_t is the volume collected at time = t .

$V_{\text{final}} - V_t$ is proportional to the concentration of the benzenediazonium chloride.

(i) Complete Table 3.1. [1]

(ii) Plot a graph on the grid in Fig. 3.1 to show the relationship between $V_{\text{final}} - V_t$ and time. Use a cross (x) to plot each data point.

Draw a curved line of best fit through the plotted points. [2]

(iii) Circle the **one** point on the graph that you consider to be most anomalous. [1]

(iv) Suggest **one** reason to explain the anomalous point you have circled.

Assume no error was made in the measurement of volume.

.....

..... [1]

Fig. 3.1

(v) Use your graph to find the first two successive half-lives, $t_{1/2}$, for this reaction.

State the coordinates of both points you used in each of your calculations.

first $t_{1/2}$: coordinates and

half-life = min

second $t_{1/2}$: coordinates and

half-life = min
[2]

(vi) Use your answer to (c)(v) to state the order of the reaction with respect to the benzenediazonium chloride. Explain your answer.

If you were unable to obtain an answer to (c)(v) you may use the values 8.6 min and 11.0 min for the half-lives. These are **not** the correct values.

order =
